

Practical 6: Objects in JS

Q1. What is the difference between “==” and “===”?

Q2. What is an object in JavaScript? Create an empty object and print it and its type.

Q3. Create an object with the property as the name of the country and the capital as its value and print one of the property value.

Q4. Create an object person with property: first name, last name, age, blood group, and use the for-in loop to print all the properties and their value.

Q5. Create an object in JavaScript and print the object after deleting one of its properties.
